

The Prevention Of Dental Caries And Oral Sepsis Volume 2

The Prevention of Dental Caries and Oral Sepsis

Excerpt from The Prevention of Dental Caries and Oral Sepsis When this work was commenced nearly six years ago, a plan of campaign was drawn up to which it was decided to adhere, and to continue the work until the whole field had been covered, or at least investigated to some extent. It was further decided to publish nothing until the chain of evidence was more or less complete. This has obvious disadvantages, one of which is the length to which the subject has grown, and another the fact that in several matters the results have been forestalled in publication by others working along similar lines. The work, like all work, is still incomplete, but sufficiently important conclusions have been reached, I think, to justify publication. The Prevention of Dental Caries and Oral Sepsis (Classic Reprint)

Excerpt from The Prevention of Dental Caries and Oral Sepsis The fact of the first edition being exhausted in the year following its publication has allowed but small opportunity for the insertion in the present edition of much that I had hoped to include, more especially in relation to work being done by others along similar lines in America, particularly by Drs. Gies, Lothrop, and Howe, and my own investigation into the cause of immunity in less civilized Maori children. Nevertheless, some fresh subjects have been broached in the present edition. These include accounts of our investigations into the bacteriology of the mouths of immune Maori children, the anatomy and physiology of mastication, thyroid insufficiency and dental caries, and the relationship between oral and other alimentary secretions. These subjects are dealt with in Chapters III., IV., XIII., and XVII. respectively. Also, additional experiments are described bearing on the solubility of the enamel surface in carbon dioxide, the neutralizing powers of tooth substance and saliva, the viscosity of saliva, the action of sulphocyanates in saliva, the digestion of starch, the effects of sugar-cane, white bread, and whole-meal bread on the teeth. Considerable additional evidence has been collected showing the lack of toughness or of fibrous elements in the food of races immune to caries. A number of fresh illustrations are also included. This work has grown so largely since its inception that its original claim to be the R.C.S.E. Cartwright Prize Essay for 1910 can no longer be sustained. My sincere thanks are due to my friend Mr. R. H. Pardoe for his invaluable assistance in seeing both editions through the press, and to the publishers for the courtesy and thoroughness with which the wishes of the author have been carried out under the somewhat difficult circumstance of his being fourteen thousand miles away. Cawson's Essentials of Oral Pathology and Oral Medicine E-Book

Case reports and clinical trials conducted in various countries show, more and more frequently, a positive correlation between the presence of original teeth and prevalence of root caries in older age. Because this is a global trend, it is likely that the predicted increase in the worldwide elderly population may soon cause a significant increase in the number of people requiring effective means of preventing and treating root surface caries. In response to this development, a team of outstanding contributors has reviewed the most important aspects of root caries. This new volume presents their findings along with discussions of how to deal with this health issue that progressively affects the oral health balance. The chapters in this book are divided in four core parts: Epidemiology, Biological Determinants, Lesion Assessment and Features and Preventive and Operative Therapies. The collection of state-of-the-art articles provides a broad overview and will serve as a reference for clinicians as well as scientists and, hopefully, will encourage new research.

Dental Caries

Indispensable for dentists, dental students and community dental programs With the mass-marketed introduction of fluoride in toothpaste in the 1950s, toothbrushing with paste became indispensable for good oral health. Both the industry and the dental profession had a shared interest in advocating the widespread correct use of good quality toothpaste. This publication starts with a general introduction on the purpose, history and composition of toothpaste. The following chapters deal with the clinical evidence of its effectiveness in caries prevention, reducing and preventing plaque, gin-givitis, halitosis, and calculus formation, facilitating removal and prevention of extrinsic stain, and preventing dentine hypersensitivity and erosion. Later chapters provide valuable information on the abrasiveness of the pastes, the substantivity of active ingredients in the oral cavity and the possible models to study the effectiveness of the pastes when full-scale clinical trials are not possible. The final chapter focuses on the frequency of toothbrushing and post-brushing rinsing behavior. The book provides indispensable information for dentists, dental students and community dental programs on whether toothpastes can be recommended to patients for specific aims and how to use them to obtain the best effect.

Textbook of Preventive and Community Dentistry

Information is presented on the action of fluoride, and the evidence relating to the use and effectiveness of remineralization agents and biomimetic materials is reviewed. Additionally, the effects of antimicrobials such as chlorhexidine and ozone are summarized. Further chapters focus on dietary counseling (with information on sweeteners and probiotics), the effectiveness of sealants in caries prevention, and resin infiltration. The philosophy of prophylaxis and ways to improve patient compliance and achieve proper mechanical plaque removal are discussed. The book is concluded with a chapter discussing preventive actions in representative cases.

X-rays and lasers are used to detect dental caries. It can be prevented by practicing a healthy oral health regime such as regular teeth cleaning and flossing, avoiding a sugar intensive diet and lower intake of fluorides. Dental caries is often classified to represent the severity of tooth decay accurately. It may be classified on the basis of location, rate of progression, etiology and affected hard tissues. Excerpt from Operative Dentistry for Children: A d104 Book Dealing With the Prophylactic and Curative Treatment of the Teeth of the Child, Based Upon Experiences Gained During More Than Twenty-Five Years Devoted to the Care of Children Exclusively If we are going to live up to the slogan, Add ten years to life, why not begin at the logical time, to store up good health and resistance to disease by the conservation of sound teeth and healthy soft tissues in the oral cavity? Why not be prepared to do thorough constructive work from the earliest period at which the parent can be induced to bring a child instead of saying, when consulted, as thousands of dentists are still advising, There is no need of work on the first teeth. There is the greatest need of work on these first teeth, as is proved by the fact that eighty per cent Of school children suffer from dental caries. This refusal of many dentists to care for the youngest children - and the resulting foci Of infection in the mouths of children - has brought the dental profession into disrepute. Dental caries is a preventable disease of childhood, due to incorrect diet and lack Of care. That it is not wholly due to disease is shown by children who, though ill from birth, through continuous care have perfect teeth. That it is not due to heredity is shown by children with perfect teeth where the parents have very bad teeth. Carious teeth sometimes seem to be inherited, but upon investigation will be found to be the result of imitating the bad habits Of the parents. Dental caries could be eradicated in a generation as certainly as have been yellow fever and the plagues. Instead of destroying the deadly mosquito and flea, it would only be necessary to rid the country Of the more deadly candy shop and grocery store, get most of our living from the vegetable garden and the family cow, and apply the teachings of oral hygiene. The examinations made during the war disclosed the dire results of neglected teeth in childhood. These examinations were made Of the young men of the nation; but no doubt an equal or even larger number Of girls and young women are as far below normal. This indicates that the future health and morals of the nation are in great danger. It also throws an immense responsibility upon the dental profession. In no other way could more loyal service be rendered to our country than by building up a vigorous race through eradicating dental caries in childhood.
